

# KEY FACTS ABOUT DELAWARE'S INTERSTATE HIGHWAY SYSTEM

The Dwight D. Eisenhower National System of Interstate and Defense Highways, which has been called the most ambitious public works project built since the Roman Empire, is the most critical link in Delaware's transportation system.

- Delaware has 41 miles of Interstate routes running the length of the state and connecting the state's major urban areas.
- Delaware's Interstate system, which includes two percent of all roadway lane miles in the state, carries 15 percent of all vehicle travel in the state.
- Since funding of the Interstate system was approved in 1956, vehicle miles of travel in Delaware have increased by 386 percent, the state's population has increased by 110 percent from approximately 395,000 to 830,000 and the number of vehicles in Delaware has increased by 338 percent.

The state's Interstate Highway System saves the average Delaware resident \$2,333 per year - \$1.9 billion statewide -- in reduced accident costs such as medical expenses and lost productivity, the value of saved time and fuel, and reduced apparel, food, housing and transportation costs.

- By reducing travel times, the Interstate system saves each Delaware resident 61 hours of travel time annually – 51 million hours statewide.
- Delaware's Interstate system annually reduces statewide motor fuel consumption by 24 million gallons.
- Consumer costs have been significantly lowered by the Interstate Highway System. The cost of transporting goods has been reduced because the time it takes to make trips has been decreased.
- The following chart indicates the total annual savings per person and statewide of the Interstate system.

	Per Person	Statewide (millions)
<b>Safety</b>	<b>\$30</b>	<b>\$25</b>
<b>Time and Fuel</b>	<b>\$977</b>	<b>\$811</b>
<b>Reduced Consumer Costs</b>	<b>\$1,326</b>	<b>\$1,101</b>
<b>Total</b>	<b>\$2,333</b>	<b>\$1,937</b>

**Traffic levels on Delaware's Interstate highways are increasing as travel growth outpaces the addition of new lanes.**

- Between 1990 and 2004, vehicle travel on Delaware's Interstates increased by 52 percent, while lane miles on the system increased by five percent.
- Between 1990 and 2004, the average annual amount of travel per Interstate-lane-mile in Delaware increased by 45 percent.

**Travel on Delaware's Interstate highways is safer than travel on all other roadways in the state. Delaware's Interstates provide travelers with a network of highways with a variety of safety designs that greatly reduce the likelihood of serious accidents.**

- Delaware's Interstate highways have saved approximately 200 lives in Delaware since 1956. This estimate is based on assuming that, if there were no Interstates, traffic would be carried by other major roads in the state, which have higher traffic fatality rates.
- The features that make Interstates safer than non-Interstate routes include: a separation from other roads and rail lines, a minimum of four-lanes, gentler curves and often paved shoulders, median barriers and rumble strips to warn drivers when they are leaving the roadway.

**The Interstate system is the backbone of the Delaware economy and has played a critical role in improving business productivity in the state.**

- Every year, \$20 billion in goods are shipped from sites in Delaware and another \$31 billion in goods are shipped to sites in Delaware, mostly by truck.
- Seventy-one percent of the goods shipped annually from sites in Delaware are carried by trucks and another 10 percent are carried by courier services, which use trucks for part of the deliveries. Similarly, 79 percent of the goods shipped to sites in Delaware are carried by trucks and another seven percent are carried by courier services, which use trucks for part of their deliveries.

*Data from the U.S. Department of Transportation (USDOT), the Federal Highway Administration (FHWA), the National Highway Traffic Safety Administration (NHTSA), the U.S. Census Bureau was compiled and analyzed by TRIP, a nonprofit transportation research group based in Washington, D.C.
